

MAXIMAL IDEALS AND PRIME IDEALS

DEFINITION: Let R be a ring.

- (i) An ideal I of R is a **maximal ideal** if I is proper and for any proper ideal J , $I \subseteq J$ implies $I = J$.
- (ii) Let R be commutative. An ideal I of R is a **prime ideal** if I is proper and $ab \in I$ implies $a \in I$ or $b \in I$.

THEOREM 1: Let R be a commutative ring and I an ideal.

- (i) The ideal I is maximal if and only if R/I is a field.
- (ii) The ideal I is prime if and only if R/I is an integral domain.

(1) Prime ideals vs maximal ideals:

- (a)** Use the theorem to quickly explain why every maximal ideal in a commutative ring is prime.
- (b)** Show that the ideal (2) in $\mathbb{Z}[x]$ is prime but not maximal.

(2) Prove¹ Theorem 1.

THEOREM 2: Let R be a ring. Then R has a maximal ideal.

DEFINITION: Let (P, \leq) be a partially ordered set.

- (i) A **maximal element** of P is an element $x \in P$ such that $x \geq y$ for all $y \in P$.
- (ii) A subset X of P is a **chain** if for all $x, y \in X$ either $x \leq y$ or $y \leq x$.
- (iii) A **upper bound** for a subset X is an element x such that $x \geq y$ for all $y \in X$.

ZORN'S LEMMA: Let (P, \leq) be a nonempty partially ordered set. If every chain $C \subseteq P$ has an upper bound $c \in C$, then P has a maximal element.

(3) Understanding Zorn's Lemma:

- (a)** The most common use of Zorn's Lemma occurs in the following situation: P is the collection of all subsets of some set Y ordered by inclusion ($A \leq B$ if and only if $A \subseteq B$), and S is some special family of subsets of Y . Rewrite² the statement of Zorn's Lemma in this context.
- (b)** Let $Y = \mathbb{Z}$ and P be the collection of all *finite* subsets of Y . Explain why there is no maximal element of P .

(4) Prove the Theorem.

(5) Prove that every proper ideal is contained in a maximal ideal.

(6) Prove that every prime ideal contains a minimal prime ideal.

¹Hint: For part (i), you might want to use a HW problem characterizing fields in terms of ideals.

²Meaning replace all \leq with \subseteq and unpackage the definitions of maximal element and upper bound.
